

## **Efficacy of amine fluoride/stannous fluoride mouthrinses on the reduction of plaque. A clinical controlled study.**

### **CONCLUSIONS**

Rinsing with AmF/SnF<sub>2</sub> formulations in addition to toothbrushing inhibits plaque to a greater extent in comparison to brushing alone. The two amine fluoride formulas were equally effective with regard to plaque control.

The adjunctive long-term use of amine fluoride/stannous fluoride rinse offers advantages in plaque control for patients with gingivitis.
